

# 3-3.2-15

AI24BTECH11012 - Pushkar Gudla

**Question:** The construction of a  $\triangle ABC$ , given that  $BC = 6\text{cm}$ ,  $\angle B = 45^\circ$  is not possible when difference of **AB** and **AC** is equal to

- 1) 6.9cm
- 2) 5.2cm
- 3) 5.0cm
- 4) 4.0cm

**Solution:** Using the cosine formula in  $\triangle ABC$ ,

Variable	Description
$a$	Length of side <b>BC</b> = 6cm
$b$	Length of side <b>AC</b>
$c$	Length of side <b>AB</b>
$k$	$k = b - c$
$\angle B$	$45^\circ$

TABLE 4: Variables and given data

$$b^2 = a^2 + c^2 - 2ac \cos B \quad (4.1)$$

$$(k + c)^2 = a^2 + c^2 - 2ac \cos B \quad (4.2)$$

$$\Rightarrow c = \frac{a^2 - k^2}{2(k + a \cos B)} \quad (4.3)$$

$$c = \frac{36 - k^2}{2(k + 3\sqrt{2})} \quad (4.4)$$

Therefore,  $k \leq 6\text{cm}$  .
